Explain what is meant by the differential coefficient of any expression, and find the differential coefficients of--x. log (tan a;), .-, and log(vx+a + /x+b). See Williamson s Differential Calculus, 7; Todhunter s Differential Calculus, 24. The differential coefficients required may be easily worked from first principles; but the ordinary method is the shortest, thus: --d los tan x 1 d tan x sec2 1 /V)-n(n-l). (M-r+l)(l+) - , .-. f(0)=n(n-l). (n-r+1). Hence This series terminates at the (n+l)th term, if n is a positive integer; otherwise it has an infinite number of terms. For the second example see Williamson s Differential Calculus, 60. 4. Explain the method for finding the maxima and minima values of a function of x, and show how they are distinguished from each other. See Todhunter s Differential Calculus, 211; Williamson s Differential Calculus, 138. 5. Find the maxima and minima values of------, and J ar+a?.a This may also be shown by examining the sign of the second differential coefficient when x=a(--1+ s/ 2)....
