

Traumatic Patellar Dislocation

By Petri Sillanpaa

LAP Lambert Acad. Publ. Mai 2009, 2009. Taschenbuch. Book Condition: Neu. 220x150x7 mm. Neuware - Traumatic patellar dislocations are considered to be a consequence of active lifestyle and defined as acute ligamentous knee injury. The management of a primary traumatic patellar dislocation has been controversial. The medial patellofemoral ligament (MPFL) has been recognized as the primary medial stabilizer of the patella. This thesis book investigates the incidence, risk factors initial management of primary traumatic patellar dislocation, the long-term results of MPFL reconstruction and the clinical significance of the MPFL injury in primary traumatic patellar dislocation. The results of the studies of this thesis disclosed that primary traumatic patellar dislocation is a common knee injury. To explore the clinical significance of the MPFL injury location, the magnetic resonance imaging evaluation proved that a femoral avulsion of the MPFL predicted subsequent instability and lower return to preinjury level of activity than other MPFL injury locations. 120 pp. Englisch.

Reviews

This book is definitely not straightforward to get started on studying but extremely exciting to read. It is really simplistic but shocks in the 50 percent of the ebook. Once you begin to read the book, it is extremely difficult to leave it before concluding.

-- **Ally Reichel**

This publication is amazing. It is definitely basic but shocks in the fifty percent of your publication. You wont feel monotony at anytime of your own time (that's what catalogues are for concerning if you question me).
